1.0 INTRODUCTION

1.1 BACKGROUND

This Functional Servicing and Stormwater Management Report (FSR) has been prepared on behalf of 1764174 Ontario Inc. in support of a Zoning By-Law Amendment application for a net site area of 0.446 ha.

The subject site is located at the south-east corner of Eglinton Avenue West and Gilbert Avenue at the municipal address of 2343 Eglinton Avenue West in the City of Toronto – York District. The site is bound by commercial buildings to the north, residential to the east and south, and a park to the west. **Figure 1 – Site Location** illustrates the subject site within the context of its surroundings. Existing underground servicing infrastructure is available on Eglinton Avenue West, Gilbert Avenue and Caledonia Road. The existing 0.461 ha site currently contains a single-storey Shoppers Drug Mart store. For the existing conditions, a topographical survey of the site has been included in **Appendix A**.

The proposed mixed-use (commercial/residential) development consists of a forty-three (43) storey building with two (2) levels of underground parking. Refer to **Appendix A** for the Site Plan prepared by Raw Design Inc.

This Functional Servicing Report has been prepared to address the site servicing strategy (stormwater, sanitary, and water) in support of a Zoning By-Law Amendment application. The proposed servicing works (including stormwater conveyance) will be designed to meet City of Toronto Design Guidelines.

2.0 STUDY PARAMETERS

This Report is based on the review of the following documents and drawings:

- **Architectural Plans** prepared by Raw Design Inc.
- **Hydrogeological Report** prepared by GEMS
- **Plan and Profile Drawings, Gilbert Avenue and Caledonia Road (SEW-237-2, GRA-146, Roll-Pav-91-5, Roll-SEW-234A)**, provided by City of Toronto
- **City of Toronto Wet Weather Flow Management Guidelines**, prepared by City of Toronto, Revised November 2006
- **City of Toronto Sewer and Watermain Design Criteria**, prepared by City of Toronto, Second Edition, Revised September 2022
- **City of Toronto Sewer Atlas Maps**, prepared by City of Toronto, Third Edition January 2010

3.0 WATER SUPPLY

3.1 EXISTING WATER SUPPLY

There is an existing 150 mmø watermain on the south side of Eglinton, an existing 150 mmø watermain on Gilbert Avenue, and an existing 300 mmø watermain on Caledonia Road. The existing Shoppers Drug Mart is serviced by a connection to the existing 300 mmø watermain on Caledonia Road. There is an existing hydrant north of the subject site on Caledonia Road and north-west of the subject site on Eglinton Avenue West.

3.2 PROPOSED WATER SUPPLY

The site will be serviced by one (1) standard “h” connection to the existing 300 mmø watermain on Caledonia Road. As per Building Code 3.2.9.7 (4), since the building is more than 84 m high, measured between grade and the ceiling level of the top storey, the building shall be served by no fewer than two sources of water supply from a public water system. Therefore, an additional fire connection is proposed to connect to the 300 mmø watermain on Caledonia Road with an isolation valve between both proposed connections. Refer to the **Site Servicing Plan** for the proposed watermain service connection location.

The City of Toronto’s design criteria states that the water demand used for watermain size selection should be sufficient to satisfy maximum day demand plus fire flow or the peak hour demand, whichever is greater. Fire flow for residential areas will not be less than 4,800 L/min for a 2-hour duration in addition to the maximum daily domestic demand, delivered with a residual pressure of not less than 140 kPa. For commercial, institutional and industrial areas, the minimum fire flow available will not be less than 5,000 L/min for 4 hours, delivered with a residual pressure of not less than 140 kPa. Fire demand was calculated as per the Fire Underwriter’s Survey (FUS) guidelines (2020).

Refer to **Appendix B** for the supporting calculations of the following proposed flows:

- Maximum Hour Demand = 385.2 L/min
- Maximum Day Demand = 200.9 L/min
- Fire Flow Demand (2.0 hours) = 5,000 L/min
- Maximum Day Demand plus Fire Flow Demand = **5,201 L/min** (governs)

City of Toronto design criteria dictates the following system pressure requirements:

- Average Day and Maximum Day range = 350 kPa to 550 kPa
- Minimum hour and peak hour range = 275 kPa to 700 kPa
- Minimum pressure under any non-fire demand scenario = not less than 275 kPa
- Minimum residual pressure during maximum day plus fire scenarios = not less than 140kPa
- Maximum static pressure = 690kPa

A hydrant flow test was conducted on the existing 300 mmø watermain on Caledonia Road, at the property frontage of the subject site. The system has a static pressure of 88 psi and a residual pressure of 74 psi at a flow of 1,894 US GPM. Based on these results and utilizing the accepted calculation method of the National Fire Protection Agency (NFPA), the available flow from this main at the minimum residual pressure allowed by City of Toronto criteria of 140 kPa would be approximately 17,808 L/min. Refer to **Appendix B** for the supporting calculations.

Based on the flow test results, the pressure and flow within the existing watermain system on Caledonia Road meets the requirement to accommodate both water service connections for the proposed development without requiring external watermain upgrades. The flow test results for the existing watermain are included in **Appendix B**.

4.0 FOUNDATION DRAINAGE

Discharge of foundation drains to municipal sewers must be in accordance with Toronto Municipal Code, Chapter 681 Sewers. The quality limits for discharge in the sewers must satisfy the limits as listed in Table 1 – Limits for Sanitary and Combined Sewer Discharge and/or Table 2 – Limits for Storm Sewer Discharge of Chapter 681. A Permit To Take Water (PTTW) from the Ministry of Environment, Conservation and Parks (MECP) through an online process is required for Short Term water taking between 50 m^3/day and 400 m^3/day. A PTTW is required for Long Term water taking from a permanent drainage system greater than 50 m^3/day. A permit is required from the City of Toronto for both short-term and long-term discharges to the municipal sewer system.

A Hydrogeological Report was prepared by GEMS, dated February 4, 2025, for the proposed development. Refer to **Appendix E** for the main body of the report.

Short-Term (Construction) – Groundwater rates (including the 100-year rainfall event) are expected to be no more than **278.50 m^3/ day (3.22 L/s)**. A limited PTTW from the MECP will be required for construction dewatering. The discharge will be to the 750 mmø combined sewer located on Caledonia Road. The water quality exceeded the Toronto Table 1 Sanitary/Combined Sewer Discharge Limits. Groundwater quality is expected to change over time during active construction dewatering. The dewatering contractor should assess the groundwater quality before any water-taking and discharging activities. Details of Construction (short-term) dewatering that satisfies Toronto Municipal Code, Chapter 681 Sewers will be provided by a dewatering contractor prior to construction in order to obtain a short-term discharge permit from the City.

Based on the above estimate, a permit to take water would not be required for water taking during the dewatering and construction of the proposed development, as the forecasted groundwater rate is less than 400,000 L/day. However, an Environmental Activity and Sector Registry (EASR) would be required for water taking during the dewatering and construction of the proposed project, as the forecasted groundwater dewatering rate is greater than 50,000 L/day.

Long-Term Discharge - As of January 1, 2022, the City of Toronto Foundation Drainage Policy prohibits post-construction discharge of groundwater into the municipal sanitary/combined sewer system. As such, the proposed structure is to be watertight and there will be no long-term groundwater discharge to the municipal sewer.

5.0 SANITARY SERVICING

5.1 EXISTING SANITARY SERVICING

The existing Shoppers Drug Mart store is likely serviced by the existing 750 mmø combined sewer on Caledonia Road. There are also an existing 300 mmø combined sewer along Eglinton Avenue West which ultimately discharges flows to the 750 mmø combined sewer on Caledonia Road and 300 mmø combined sewer which flows south along to Gilbert Avenue.

Any existing connections will be abandoned upon redevelopment. Based on existing conditions, it is estimated that the existing peak sanitary flow is approximately **0.25 L/s**.

5.2 PROPOSED SANITARY SERVICING

The site will be serviced by a new connection to the 750 mmø combined sewer within Caledonia Road. Refer to the **Public Utilities and Site Servicing Plan** for the proposed location of the sanitary service connection. Using the City of Toronto Sanitary Design criteria, the equivalent population for the proposed mixed-use development is approximately **1173 persons**. The peak sanitary flow for the proposed development has been calculated to be **12.44 L/s** which is an increase of **12.19 L/s** (0.25 L/s existing peak sanitary flow vs 12.44 L/s proposed peak sanitary flow) for the peak flow to the combined sewer system. Refer to **Appendix C** for detailed calculations.

As discussed later in **Section 6.0 - Stormwater Servicing,** it is proposed to redirect the stormwater flows from the 750 mmø combined sewer on Caledonia Road and 300 mmø combined sewer on Eglinton Avenue to the combined sewer on Gilbert Avenue. Therefore, the increase in sanitary flows under post development conditions will be offset by the decrease in storm flows as a result of the proposed removal of storm flows from the 750 mmø combined sewer on Caledonia Road. **Table 1** below summarizes predevelopment and post development flows from the site to the 750 mmø combined sewer on Caledonia Road.

Table 1 – Site Predevelopment and Post Development Flows to Combined Infrastructure

Storm Event	Predevelopment			Post development		
	Storm Runoff (L/s)	Sanitary Flows (L/s)	Total Flows to Sewer (L/s)	Storm Runoff (L/s)	Sanitary Flows (L/s)	Total Flows to Sewer (L/s)
2-Year	86	0.25	**86.25**	0	12.44	**12.44**
100-Year	243	0.25	**243.25**	0	12.44	**12.44**

As shown in **Table 1,** there will be no increase in flows to the 750 mmø combined sewer on Caledonia Road. In the 2-Year Storm event, there will be a decrease of **73.77 L/s** to the combined sewer infrastructure downstream of the site.

5.3 COMPLIANCE WITH MECP PROCEDURE F-5-5

As discussed later in **Section 6.0 - Stormwater Servicing,** the existing stormwater flow under 2-year storm event is calculated to **13 L/s** on the combined sewer in Gilbert Avenue, and post-development release rate to Gilbert Avenue by underground storage tank is **34.0 L/s**, thus the redevelopment will cause a net stormwater flow increase of **21.0 L/s** (34.0-13=21.0 L/s) on the combined sewer in Gilbert Avenue.

The City of Toronto has began major construction on the Fairbank-Silverthorn Storm Trunk Sewer System Phase 2 – Local Collector Storm Sewers as part of the Areas 3 Basement Flooding Study. This improvement, identified as contracts 23ECS-MI-02FS and 23ECS-MI-03FS in the Areas 3 Basement Flooding consists of "*Construction of a large-diameter storm sewer tunnel, Construction of approximately 17 km of new local storm sewers on various streets to separate combined sewers and to collect stormwater and send it to the tunnel, and Installation of approximately 330 inlet control devices to restrict stormwater from entering existing combined sewers.*"

It is anticipated to see reduction of the flow to the combined system by the disconnection of catchbasins from combined sewers located upstream of the site and the reconnection of the catchbasins to a newly constructed storm sewers. The flow reduction will offset the net increase of **21.0 L/s** flow on Gilbert Avenue from the new development. Therefore, it can be concluded that there will be no increase in Combined Sewer Overflow (CSO) and as such the development is in compliance with MECP Procedure F-5-5 and a new storm sewer connection to the combined sewer should be permitted.

6.0 STORMWATER SERVICING

6.1 EXISTING CONDITIONS

There is an existing 300 mmø combined sewer on Gilbert Avenue that conveys storm flows south along Gilbert Avenue. There is an existing 300 mmø combined sewer on south side of Eglinton Avenue West that conveys storm flows east to the existing 750 mmø combined sewer on Caledonia Road. The 750 mmø combined sewer on Caledonia Road conveys storm flows south and ultimately to Lake Ontario.

Refer to **Figure 2 – Existing Storm Drainage** for details on the existing drainage patterns for the site in existing conditions. The existing drainage is summarized below:

- Area 100 – 0.402 ha, C=0.87 (to Caledonia Road – 750 mmø Combined Sewer)
- Area 101 – 0.059 ha, C=0.90 (to Gilbert Avenue – 300 mmø Combined Sewer)

Under existing conditions, the uncontrolled flows to the storm sewers on Gilbert Avenue and Caledonia Road are summarized in the table below:

Table 2 – Predevelopment Storm Flows

Storm Event	Total Uncontrolled Storm Runoff to 750mm Combined Sewer on Caledonia Rd. (L/s)	Total Uncontrolled Storm Runoff to 300mm Combined Sewer on Gilbert Ave. (L/s)
2-Year	86	13
5-Year	128	19
10-Year	158	24
25-Year	184	28
50-Year	218	33
100-Year	243	37

Refer to **Appendix D** for calculations.

6.2 ALLOWABLE RELEASE RATE

The sites imperviousness under existing conditions is higher than 50%. Based on the City's Wet Weather Flow Management Guidelines, the maximum value of C (Runoff Coefficient) used in calculating the pre-development peak runoff rate is limited to 0.50 for the 2-year storm event. As the existing properties are greater than 50% impervious, this rule applies.

The allowable minor system discharge from the subject site is calculated without the area dedicated to the City as follows:

$$\mathbf{Q_A = C \times A \times i \times N\ (L/s)}$$

Table 3 - Allowable Release Rate

A - Site Area (ha)	0.4612
Tc (min)	10
C - Runoff Coefficient	0.50
i - Intensity	88.19
N – Constant	2.778
Q - Release Rate (L/s)	**56.5**

The allowable release rate for the subject site is **56.5 L/s**. Refer to **Appendix D** for the allowable release rate calculations.

6.3 PROPOSED STORMWATER SERVICING

In the post-development condition, the proposed mixed-use (commercial/residential) development will be a forty-three (43) storey building with two (2) levels of underground parking. Refer to the land use breakdown for the uncontrolled area and the remainder of the site in the table below.

Table 4: Proposed Land Use Breakdown

Land Use	Area (ha)	'C'
SITE		
Green Roof	0.0106	0.0047
Non-Green Roof	0.2952	0.2657
Impervious Area	0.0923	0.0826
Pervious Area	0.0465	0.0114
Total Area	**0.4446**	
UNC		
Impervious Area	0.0090	0.0081
Pervious Area	0.0075	0.0019
Total Area	**0.0165**	

This report has been prepared in accordance with the criteria set by the City of Toronto Weather Flow Management Guidelines (WWFMG). Since there is no existing storm sewer within Gilbert Avenue, Eglinton Avenue and Caledonia Road around the site at this time, the site will be serviced by the 300 mmø combined sewer located on Gilbert Avenue. Refer to the **Site Servicing Plan** for the proposed location of the storm connection.

There may be runoff from rainstorms that exceed the capacity of the City's sewer connection. Therefore, should the storm outlet for the site become plugged, the at-grade access lid to the underground storage tank at the property line will lift and water will discharge overland to Gilbert Avenue.

The owner shall be responsible to provide flood protection or a safe overland flow route for the proposed development without causing damage to the proposed and adjacent public and private properties. Existing drainage patterns on adjacent properties shall not be altered and stormwater runoff from the subject development shall not be directed to drain onto adjacent properties.

6.4 QUANTITY CONTROL

The allowable site release rate for the proposed development was determined by calculating the 2-year peak flow with a maximum value of 50% impervious as per the City of Toronto Wet Weather Flow Management Guidelines. Using the pre-development subject site area, the allowable release rate of the site was determined to be **56.5 L/s**. Uncontrolled Area UNC (0.015 ha) will produce a peak runoff of **6.9 L/s** during the 100-year storm event.

Quantity control will be provided on-site by an underground storage tank within the P1 level of the building in combination with an outlet control device to ensure that the 100-year post redevelopment peak flows from the site are attenuated to **49.6 L/s**. A storage volume of approximately **134 m^3** in the tank will be required to control the 100-year post development flows to the allowable release rate. Note that an additional **15.9 m^3** volume will be required for the water reuse cistern portion of the tank. Refer to **Appendix D** for detailed calculations.

Table 4 – Peak Flow and Storage Summary - 100-Year Storm Event

Area ID	Area (ha)	Runoff Coefficient	Storage Available (m^3)	Storage Required (m^3)	Release Rate (L/s)	Orifice Size (mm)	Description
UNC	0.0165	0.60	N/A	N/A	6.9	Uncontrolled	
SITE	0.4446	0.82	188	154	34.0	Orifice	At SPA
TOTAL	0.4611				40.9		

1. Refer to **Appendix D** for modified rational calculations.

As shown in **Table 4** above, the proposed site release rate of **40.9 L/s** during the 100-year storm event is lower than the allowable site release rate of **56.5 L/s**. Refer to **Appendix D** for storage volume calculations. It is expected that the proposed development will not result in any adverse impacts to the existing storm sewer system on Weston Road. Refer to **Figure 3 – Proposed Storm Drainage** for the locations of the proposed post-development surface areas. In situations where the outlet control device is not sufficient, the at grade access lid to the underground storage tank at the property line will lift and water will discharge overland to Weston Road. The design of all internal piping within the building must provide adequate capacity for full capture and conveyance of all flows generated by storms up to and including the 100-year rainfall event. All design and associated calculations for the internal storm system, including the design of the internal inlet structures, piping and mechanical appurtenances is to be completed by the Mechanical Engineer.

CHECKED BY: DZ	
SCALE: 1:500	FIGURE No. 3

6.5 WATER BALANCE

The Wet Weather Flow Guidelines indicate that the minimum on-site runoff retention requires the proponent to retain all runoff from a small design rainfall event – typically 5 mm (In Toronto, storms with 24-hour volumes of 5 mm or less contribute about 50% of the total average annual rainfall volume). This runoff must be retained through infiltration, evapotranspiration or rainwater reuse. As the building footprint occupies the majority of the site, the opportunity for infiltration is not feasible.

To achieve the water balance objectives, the site was categorized by surface types: green roof area, non-green roof area, impervious paved area, and pervious landscaped area. The initial abstraction values for the impervious surfaces and pervious surfaces were 1 mm and 5 mm, respectively. The initial abstraction was determined based on percent of surface area and initial abstraction values of each surface type. Without any specific on-site retention measures, the proposed development would achieve the following levels of water balance as seen in **Table 5**.

Table 1: Achieved Water Balance

Site Description	Fraction of Site Area		Initial Abstraction (mm)	Overall Initial Abstraction (mm)
Green Roof	2.3%	0.0106 ha	5.0	0.11
Non-Green Roof Area	64.0%	0.2952 ha	1.0	0.64
Impervious Paved Area	22.0%	0.1013 ha	1.0	0.22
Pervious Landscaped Area	11.7%	0.0540 ha	5.0	0.59
Total	**100.0%**	**0.4611** ha		**1.56**

Based on **Table 5**, the site will have a shortfall of 3.44 mm (5 mm – 1.56 mm) of initial abstraction. This is equivalent to approximately **15.9 m^3** of storage. The proposed water balance volume will be utilized for on-site irrigation. Details regarding the utilization of the water balance volume will be provided during the Site Plan Control stage.

6.6 QUALITY CONTROL

The installation of a media filtration device (Stormfilter unit) is proposed to achieve the City's requirement of 80% TSS removal. Runoff from non-vehicular areas such as rooftop surfaces is considered to be free of oil and grit and does not require water quality treatment. The unit will be sized to accommodate the storm runoff from the at grade areas being conveyed to the tank and to remove an overall TSS of 80%. The proposed development would achieve the following levels of TSS removal efficiency as seen in **Table 6**.

Table 2: Achieved Water Quality Control

Type of Area	Total TSS Removal (%)	Area	Units	Percent Redevelopment Area (%)	Overall % TSS Removal Efficiency
Green Roof	80%	0.0106	ha	2.3%	1.8%
Non-Green Roof Area	80%	0.2952	ha	64.0%	51.2%
Impervious / Paved Area	80%	0.1031	ha	20.0%	16.0%
Pervious / Landscaped Area	96%	0.0357	ha	10.1%	9.7%
Uncontrolled Impervious / Paved Area	0%	0.0090	ha	2.0%	0.0%
Uncontrolled Pervious / Landscaped Area	80%	0.0075	ha	1.6%	1.3%
Total Area		**0.4611**	**ha**	**100.0%**	**80.1%**

7.0 EROSION AND SEDIMENT CONTROL

During construction, erosion and sediment control will be implemented on site. This will be achieved through methods such as installation of a silt fence around the perimeter of the site, placement of mud mats at site access points to municipal roadways and the use of sediment control barriers at catchbasins located in proximity to the site.

The erosion and sediment control measures proposed during construction will be designed, constructed, and maintained on-site in accordance with the TRCA's Erosion and Sediment Control Guidelines for Urban Construction (2019) and/or City of Toronto requirements.

8.0 CONCLUSIONS

This Functional Servicing and Stormwater Management Report presents a site servicing strategy for the proposed development that addresses the requirements of the applicable design guidelines and provides the basis for detailed servicing design.

We trust this report sufficiently addresses the site servicing and stormwater management requirements and allows for approval of the proposed Zoning By-law Amendment application of the subject site for the proposed use described herein. Should there be any questions or comments, please feel free to contact the undersigned.

Sincerely,
Counterpoint Engineering Inc.

SITE PLAN NOTES

1. THE BUILDING IS TO BE SPRINKLERED.
2. TORONTO HYDRO STREET LIGHTING AND TYPE TO BE COORDINATED WITH AND APPROVED BY TORONTO HYDRO.
3. ALL WASTE GENERATED BY THE SITE TO BE STORED ON PRIVATE PROPERTY.
4. SIDEWALKS AND BOULEVARDS WITHIN THE RIGHT OF WAY TO HAVE A MINIMUM 2% AND MAXIMUM 4% SLOPE TOWARDS THE ROADWAY.
5. REFER TO SITE SERVICING PLAN, PREPARED BY COUNTERPOINT ENGINEERING, FOR SEWER AND WATER SERVICE INFORMATION.
6. ALL EXISTING ACCESSES, CURB CUTS, TRAFFIC CONTROL SIGNS, ETC. ALONG THE DEVELOPMENT SITE FRONTAGES THAT ARE NO LONGER REQUIRED ARE TO BE REMOVED. THE BOULEVARD WITHIN THE PUBLIC RIGHT OF WAY, IN ACCORDANCE WITH CITY STANDARDS AND TO THE SATISFACTION OF THE EXECUTIVE DIRECTOR OF TECHNICAL SERVICES ARE TO BE REINSTATED.
7. TYPICAL PARKING SPACES ARE 2.6m X 5.6m. SPACES WITH ADJACENT OBSTRUCTIONS OF A DEPTH GREATER THAN 1m TO HAVE A TYPICAL ALLOWANCE OF 0.3m FROM PARKING SPACE.
8. ALL SMALL CAR PARKING SPACES TO BE CLEARLY SIGNED AT THE FRONT OF EACH SPACE AS "SMALL CAR ONLY"
9. EXTERIOR LIGHTING WILL BE FULL CUT-OFF FIXTURES (OR DARK SKY COMPLIANT) SO THAT NO UP-LIGHTING WILL BE PRODUCED FROM THESE LIGHTS AND EXTERIOR LIGHT FIXTURES ARE SHIELDED TO PREVENT GLARE AND LIGHT TRESPASS ONTO ANY NEIGHBORING PROPERTIES
10. SHORT-TERM BIKE PARKING: MIN. LENGTH 1.8m, MIN. WIDTH 0.6m,MIN. VERTICAL CLEARANCE 1.9m

REQUIRED FIRE FLOW WORKSHEET
Fire Underwriters Survey

Project : **2343 Eglinton Avenue West**
Project No: **23073**

Guide for Determination of Required Flow Copyright I.S.O, 2020

$$RFF = 220C\sqrt{A}$$

Where:

RFF = the Required Fire Flow in litres per minutes (LPM)
C = the Construction Coefficient is related to the type of construction of the building
A = the Total Effective Floor Area (effective building area) in square metres of the building

Construction Coefficient (C)

Note that the construction typology used by the insurance industry and public fire protection differs from the terms of reference in the National Building Code of Canada (NBC).

The following Construction Types and Coefficients are used in the required fire flow formula:

C = 1.5 for **Type V** Wood Frame Construction
= 0.8 for **Type IV-A** Mass Timber Construction
= 0.9 for **Type IV-B** Mass Timber Construction
= 1.0 for **Type IV-C** Mass Timber Construction
= 1.5 for **Type IV-D** Mass Timber Construction
= 1.0 for **Type III** Ordinary Construction
= 0.8 for **Type II** Noncombustible Construction
= 0.6 for **Type I** Fire Resistive Construction

Type of Construction		Class Factor
V & VI-D	Wood Frame	1.5
IV-C & III	Ordinary Construction	1.0
IV-A & II	Non-Combustible	0.8
I	Fire-Resistive	0.6

Contents		% Reduction
NC	Non-Combustible	25
LC	Limited Combustible	15
C	Combustible	0
FB	Free Burning	15
RB	Rapid Burning	25

Noncombustible Construction (Type II)
A building is considered to be of Noncombustible construction (Type II) when all structural elements, walls, arches, floors, and roofs are constructed with a minimum 1-hour fire resistance rating and are constructed with noncombustible materials.

1) Fire Flow

Type of Construction:	I		
C=	0.6		
A=	3941	m^2	NOTE: 2nd FL=2,627.0m^2, 3rd FL= 2,627.0m^2, 4th FL=2,627.0m^2
F=	8,000	**L/min**	(round to nearest 1,000 L/min)

Note: Assuming building is fire-resistance and all vertical openings and exterior vertical communications are protected in accordance with the National Building Code. Area is the total of the largest floor (Level 3) plus 25% of the next 2 immediately adjoining floors.

2) Occupancy Reduction

Contents Factor:		LC			
Reduction of		-15%		=	-1,200 L/min
F=	8000L/min +	-1200	L/min	=	6,800 **L/min**

3) System Type Reduction

NFPA 13 Sprinkler:		YES	30%		
Standard Water Supply:		YES	10%		
Fully Supervised:		YES	10%		
Total			50%		
Reduction of		50%	L/min	=	3,400 L/min
F=	6800L/min -	3,400	L/min	=	3,400 **L/min**

4) Separation Charge

Building Face	Dist(m)	Charge			
North	36	0%			
East	26	10%			
South	10	20%			
West	39	0%			
Total		30%	**of**	6,800 **L/min** =	2,040 **L/min**

(max exposure charge can be 75%)

Separation Distance	Maximum Exposure Adjustment Charge
0 m to 3 m	25%
3.1 m to 10 m	20%
10.1 m to 20 m	15%
20.1 m to 30 m	10%
Greater than 30	0%

F= 3400L/min + 2040L/min = 5,440 **L/min** (2,000L/min<F<45,000L/min)

F=	5,000	**L/min**
F=	83	**L/s**
F=	1,321	**gpm**

(round to the nearest 1,000L/min)

counterpoint engineering

NFPA Theoretical Flow Calculations

Project Name: **2343 Eglinton Avenue West**
Project Number: **23073**

Based on National Fire Protection Association Guidelines, the available flow at the minimum residual pressure of 20psi can be calculated based on the observed flow at the observed pressure readings, as follows:

$$\mathbf{Q_F = 29.83 \times c \times d^2 \times p^{0.5}}$$, where

Q_F = observed flow (US GPM)
c = hydrant nozzle coefficient (0.90 - 0.95)
d = nozzle diameter (in)
p = observed pitot pressure

$$\mathbf{Q_R = Q_F \times h_F^{0.54} / h_R^{0.54}}$$, where

Q_R = available flow
Q_F = observed flow (US GPM)
h_F = drop from measured static to desired baseline pressure
h_R = drop from measured static to measured residual pressure

Based on flow test results obtained by Lozzi Aqua Check on October 12, 2023

c =	0.95		
d =	2.5	in	
number of ports =	2		
p =	32		
Q_F =	**2004**	**US GPM**	
Measured Static Pressure =	88	psi	
Measured Residual Pressure =	74	psi	
Desired Residual Pressure =	20	psi	, minimum per City of Toronto design criteria
Q_R =	**4704**	**US GPM**	per fire conneciton
	17,808	**L/min**

List of Figures

List of Appendices

1.0 Introduction

Groundwater Environmental Management Services Inc. (GEMS) has been retained by 1764174 Ontario Inc. (the client) to prepare a Hydrogeological Report for a proposed mixed-use residential and commercial building located at 2343 Eglinton Avenue West in Toronto, Ontario. The location of the Site is illustrated in **Figure 1**.

The coordination drawing set provided by RAW dated on 7 August 2024, included as **Appendix A**, indicate the gross site area is not to exceed 4,631 squared metres (m^2). The proposed development is to include the construction of a single mixed-use residential and commercial building with 2 levels of underground parking. The excavation for underground levels is assumed to extend approximately 8.2 m below ground surface to 149.20 metres above sea level (masl).

The highest water table elevation recorded at the Site during this investigation was 151.46 masl. This suggests that excavation for the two below grade parking levels will require short-term construction dewatering to maintain a dry excavation during construction.

GEMS has reviewed the available relevant geological, environmental, and geotechnical information and has prepared this Hydrogeological Report in support of the proposed development in accordance with the Ontario Water Resources Act, Ontario Regulation 387/04, and Toronto Municipal Code Chapter 681-Sewers.

GEMS' scope of work included:

- Review of hydrogeological conditions and environmental information based on previous reports prepared for the Site
- Review of Borehole Logs created by GEMS (2023)
- Groundwater level monitoring
- Hydraulic Conductivity Testing
- Water quality analysis
- Calculation of short-term construction dewatering and long-term groundwater seepage
- Assessment of potential adverse environmental effects
- Assessment of MECP well records within 500 m of the Site

2.0 Site Conditions

2.1 Location and Land Usage

The Site is a rectangular shaped lot located at the address 2343 Eglinton Avenue West. It is on the southwest corner of Eglinton Avenue West and Caledonia Road and is approximately 2.2 kilometers west of Allen Road and 3.5 kilometres south of Highway 401 [1]. The nearest surface water body is the Humber River, located 3.6 km west of the site. The site is currently zoned as commercial residential [2].

Lands within 500 m of the Site generally consist of commercial residential, residential, open space, and residential apartment [2].

North: Commercial Residential, Residential, and Open Space.

East: Commercial Residential, Residential, and Open Space.

South: Residential, Commercial Residential, and Open Space.

West: Commercial Residential, Residential, Open Space, and Residential Apartment.

2.2 Proposed Development

1764174 Ontario Inc.'s proposed development consists of the construction of 2 residential towers at 6 and 42 storeys overtop 1 6-storey commercial podium with 2 levels of underground parking. The development will occupy an approximate total area of 4,631 m^2 as shown in the architectural drawings. The excavation is not expected to exceed more than 4,482 m^2.

The Architectural Drawings for the proposed development are provided in **Appendix A.**

3.0 Methodology

3.1 Drilling Program

On 2 October 2023 to 10 October 2023, GEMS carried out a field investigation including the advancement of 5 boreholes denoted as MW1 through MW5 in support of their geotechnical investigation. All boreholes were equipped with schedule-40, Polyvinyl chloride (PVC) monitoring wells, with screened intervals of 3.0 m length at their base.

The monitoring wells were installed to evaluate static groundwater elevations, conduct hydraulic testing, and obtain water quality samples. All monitoring wells were purged prior to sampling using a Waterra inertial lift pump by purging at least three well volumes or until the monitoring well was purged dry. Borehole logs are provided in **Appendix B**, and a detailed Site Plan showing the borehole and monitoring well locations is presented in **Figure 2**.

3.2 Hydraulic Testing

On 10 September 2024, GEMS personnel visited the Site to complete Single Well Response Tests (SWRTs) on the monitoring wells installed in MW2 and MW4 to evaluate the hydraulic properties of the subsurface materials at the Site.

The SWRTs consisted of rising head testing performed by 'instantaneously' removing a pre-determined volume of water (a slug). Water level recovery back to static conditions was monitored using an automated water level logging device with 1 second measurement intervals and validated with manual measurements. A dedicated baro-logger was set above the water table to allow the data to be compensated for changes in atmospheric pressure.

3.3 Water Quality Sampling

On 26 October 2023, a groundwater sample was collected by GEMS personnel for an initial water quality characterization to inform decisions on means and methods related to groundwater management during construction. The sample was taken from monitoring well MW4 in accordance with GEMS' standard operating procedure for Groundwater Sampling. Using a new dedicated bailer and sterile nitrile gloves preserves sample integrity and prior to sampling activities using a Waterra inertial lift pump by purging at least three well volumes or until the monitoring well was purged dry ensures that the results are

representative of in-situ groundwater conditions. The sample collection was not filtered.

The collected groundwater sample was packed with ice in a cooler to maintain sample temperature, and the cooler was sealed and transported for analysis to Bureau Veritas, a Canadian laboratory accredited and licensed by the Standards Council of Canada and/or the Canadian Association for Laboratory Accreditation.

The sample was tested for all parameters denoted in the City of Toronto Storm Sewer and Sanitary Combined Sewer Use By-law criteria to assess the potential for discharge to the local sewer system.

4.0 Geology and Hydrogeological Setting

The Site is situated in the physiographic region detailed as the South Slope, characterized as shallow shale and till plains that slope southward towards Lake Ontario [3]. Surficial geology at the site primarily consists of deposits of Stone-poor, sandy silt to silty sand-textured till [4]. The surficial geology of the Site is displayed in **Figure 3**.

The bedrock underlaying the Site is part of the Georgian Bay Formation composed primarily of shale and limestone [5].

4.1 Subsurface Investigation

All boreholes were evaluated for this report. Boreholes MW1 through MW5 were advanced to depths between 20.0 and 40.1 metres below grade (mbg) with elevations ranging from 138.0 to 116.9 masl.

Boreholes MW1, MW2, MW3, MW4, and MW5 were installed with monitoring wells, to depths of approximately 7.9 to 19.8 mbg with elevations ranging from 150.1 to 136.2 masl. Borehole logs of the monitoring wells are provided in **Appendix B**.

The ground surface elevations at the locations of the boreholes were established utilizing a TopCon HiPer V GNSS positioning device.

The details of borehole advancement and the approximate well elevations are summarized below in **Table 4.1**.

Table 4.1 Borehole Details

Borehole ID/Well ID	Date Installed (YYYY-MM-DD)	Ground Elevation (masl)	Borehole Depth (mbg)	Borehole Depth (masl)	Well Screen Top (masl)	Well Screen Bottom (masl)
MW1	2023-09-27	159.04	40.1	118.94	154.1	151.1
MW2	2023-10-10	158.12	20.0	138.12	153.2	150.2
MW3	2023-10-02	158.69	20.0	138.69	153.8	150.8
MW4	2023-09-26	159.14	20.0	139.14	142.4	139.4
MW5	2023-10-04	158.21	40.1	118.11	153.3	150.3

4.2 Stratigraphy and Hydrogeological Conditions

Details of the subsurface and groundwater conditions at the site are given on the Borehole Log Sheets attached in **Appendix B** of this report.

The following paragraphs present a commentary on the various soil materials contacted in the boreholes. Commentary on the engineering properties of the contacted soil materials is reviewed in the Geotechnical Report, submitted under separate cover.

It should be noted that the boundaries of soil types indicated on the borehole logs are inferred from non-continuous soil sampling and observations made during drilling. These boundaries are intended to reflect transition zones for the purpose of geotechnical design, and therefore, should not be construed as exact planes of geological change.

4.2.1 Surface Cover

A 70-75 mm thick layer of asphaltic concrete is present at the ground surface of all Boreholes.

4.2.2 Fill

A fill material consisting of a gravelly sand or silty sand with varying clay concentrations can be found in all boreholes below the Asphaltic concrete layer.

4.2.1 Native Soil

The native soils present below the fill material consist predominantly of sandy clayey silt till, sand and silt, sand, silt and clayey silt, clayey silt, and sandy silt.

4.2.2 Sandy Clayey Silt (Till)

Sandy clayey silt till is present in all boreholes underlaying the fill. It extends to depths ranging from 5.6 mbg to 9.2 mbg. The sandy silt till is a glacial deposit consisting of a random mixture of soil particles ranging from clay to gravel, with silt being the predominant fraction.

The sandy clayey silt till is brown in colour and moist in appearance.

4.2.3 Sand / Sandy Silt / Sand and Silt

Sand / sandy silt / sand and silt are present below the sandy clayey silt till layer in all boreholes. It extends to depths of 25.6 mbg in MW1, 24.6 mbg in MW5, and the explored depths of MW2, MW3, and MW4.

The sand / sandy silt / sand and silt are brown in colour to the explored depths of MW3 and MW4, becoming grey at depths ranging from 13.2 mbg to 19 mbg in MW1, MW2, and MW5, and is moist to very wet in appearance.

4.2.4 Silt and Clayey Silt / Clayey Silt

Silt and clayey silt / clayey silt are present beneath the sand / sandy silt / sand and silt layers in MW1 and MW5. It extends to the explored depths of both Boreholes.

The silt and clayey silt / clayey silt are grey in colour and moist in appearance.

4.3 Groundwater Level/Elevation Monitoring

GEMS completed six site visits from 29 August 2024 to 4 November 2024 to obtain water level

measurements from the five monitoring wells (MW1, MW2, MW3, MW4, and MW5). The groundwater monitoring results collected to date are summarized below in **Table 4.3**.

Table 4.3: Monitoring Well Summary and Groundwater Elevations

Well ID	Screened Unit and Screen Depth (masl)	Ground Elevation (masl)	Static Water Levels			
			Date (YYYY-MM-DD)	Water Level (mbg)	Water Elevation (masl)	Average (masl)

			2024-10-09	13.20	145.84	
			2024-10-23	13.31	145.73	
			2024-11-04	13.33	145.71	
MW5	Sandy Clayey Silt Till 153.3 – 150.3	158.21	2024-08-29	6.97	152.07	151.31
			2024-09-10	7.33	151.71	
			2024-09-27	7.72	151.32	
			2024-10-09	7.74	151.30	

Table 4.3: Monitoring Well Summary and Groundwater Elevations

Well ID	Screened Unit and Screen Depth (masl)	Ground Elevation (masl)	Static Water Levels			
			Date (YYYY-MM-DD)	Water Level (mbg)	Water Elevation (masl)	Average (masl)
			2024-10-23	7.73	151.31	
			2024-11-04	7.73	151.31	

Groundwater elevations at the Site during the monitoring period ranged from 145.66 to 152.50 masl, and the highest level was observed in MW2 on 29 August 2024. The water table is interpreted as being approximately 150.63 masl based on an average of the water levels observed in MW1, MW2, MW3, MW4, and MW5 for the purpose of this report.

Water levels may vary due to seasonal fluctuations and precipitation.

4.4 Single Well Response Tests

Hydraulic conductivity values were calculated based on single well response tests (SWRTs) completed on 2 of the monitoring wells installed on site. On 10 September 2024, GEMS was on-Site to carry out the SWRTs, 4 total SWRTs were conducted. 3 SWRTs were completed in MW4 and 1 SWRT was completed in MW2.

For each SWRT, a 'slug' of water was removed from the well, and the water level recovery was monitored for 30 minutes thereafter, or until the well returned to its static level. Estimations of hydraulic conductivity were made in AQTESOLV Aquifer Test Analysis Software using the Hvorslev Method based on the rate of recovery [6]. Hydraulic Conductivity analysis graphs for each SWRT are provided in **Appendix C**.

The Hvorslev was chosen for its versatility and is based on the following assumptions:

- Water-bearing unit has infinite areal extent;
- Water-bearing unit is homogeneous and of uniform thickness;
- Water bearing unit is confined or unconfined;
- Water table is initially horizontal prior to testing;
- The well is fully or partially penetrating the water-bearing unit;
- The slug is instantaneously removed from the well; and,
- Groundwater flow is steady.

The estimated hydraulic conductivity results for all SWHTs are presented in **Table 4.4**.

Table 4.4: Hydraulic Conductivity Results from Single Well Response Tests

Well ID	Screened Unit	Screen Interval (masl)	SWRT	Hydraulic Conductivity (m/s)	Geometric Mean
MW2	Sandy Clayey Silt Till	153.1 – 150.1	1	5.36×10^{-8}	5.4×10^{-8}
MW4	Sand and Silt	139.2 – 136.2	1	1.48×10^{-6}	1.6×10^{-6}

			2	1.98×10^{-6}	
			3	1.52×10^{-6}	
Geometric Mean Hydraulic Conductivity (m/s) for all SWRTs					3.0×10^{-7}
Highest Hydraulic Conductivity (m/s) for all SWRTs					1.98×10^{-6}

The hydraulic conductivity results for tests in MW2 and MW4 ranged from 1.98×10^{-6} m/s to 5.36×10^{-8} m/s, with an overall geometric mean of 3.0×10^{-7} m/s.

The geometric mean of the hydraulic conductivity estimates for the silt and sand is 1.6×10^{-6} m/s, and for the sandy clayey silt till is 5.4×10^{-8} m/s. These fall within the textbook ranges for the screened materials [7].

4.5 Groundwater Quality

On 26 October 2023, a groundwater sample was collected from monitoring well MW4 to characterize the in-situ groundwater quality at the Site. The water quality analysis results are included in **Appendix D**.

Water quality results were compared to the following criteria:

- City of Toronto Sanitary and Combined By-Law
- City of Toronto Storm Sewer By-Law

The water quality exceeded the City of Toronto Storm Sewer Discharge Guidelines criteria for Phenols-4AAP, Total Suspended Solids (TSS), Total Manganese (Mn), Total PAHs, Benzene, Chloroform, Ethylbenzene, Toluene, and Total Xylenes. It also exceeded the City of Toronto Sanitary and Combined Sewer Discharge Guidelines for Benzene and Toluene.

Exceedances to these criteria is identified and are summarized in **Table 4.5**, with the criteria exceeded in bold.

Table 4.5: Water Quality Results Exceeding Discharge Criteria

Water Quality Parameters	Units	MW4 Results	Storm Criteria	Sanitary Criteria
Phenols-4AAP	mg/L	0.033	**0.008**	1.0
Total Suspended Solids (TSS)	mg/L	104	**15**	350
Total Manganese (Mn)	ug/L	170	**50**	5000
Total PAHs	ug/L	ND (1)	**2**	5
Benzene	ug/L	510	**2**	**10**
Chloroform	ug/L	5.7	**2**	40
Ethylbenzene	ug/L	130	**2**	160
Toluene	ug/L	560	**2**	**16**
Total Xylenes	ug/L	320	**4.4**	1400

ND (1): Reportable detection limit exceeds Storm Criteria

Groundwater quality is expected to change over time during active construction dewatering. The

dewatering contractor should assess the groundwater quality before any water-taking and discharging activities.

5.0 Short and Long-Term Discharge Rates

5.1 Short-Term Construction Dewatering

A construction dewatering system design may include well points, several sump pumps, and/or a network of gravity drains. Implementing a dewatering system is the responsibility of the property owner. A qualified dewatering contractor with experience in construction dewatering should be retained to design and outline the methodology of the dewatering system.

Excavation for installation of the foundations at the project will require that the groundwater level be lowered to a depth at least 1 m below the excavation invert.

A summary of the dewatering estimate assumptions is outlined in **Table 5.1**.

Table 5.1: Dewatering Estimate Assumptions

Input Parameters	Assumption	Notes
Ground Surface Elevation	158.64 masl	Average surface elevation at the borehole locations.
Finished Floor Elevation (FFE)	150.2 masl	FFE of parking level 2
Excavation Invert	149.2 masl	Assumed 1.0 metre below FFE
Dewatering Target Elevation	148.2 masl	Assumed to be 1.0 metre below the excavation invert
Excavation Area	87 m x 52 m	Area of excavation based on coordination drawing set provided by RAW in August 2024.
Max Anticipated Groundwater Elevation	154.0 masl	Maximum groundwater elevation at the Site recorded during 29 August 2024 water level measurements + 1.5 metres for peak season fluctuation allowance.
Base of Aquifer	112.03 masl	Assumed at bedrock surface (based on approximate bedrock elevations from the ORMGP database)
Hydraulic Conductivity (K)	1.98×10^{-6} m/s	Highest K value estimated from SWRT tests (MW2 and MW4)

Dewatering estimates have been calculated assuming an excavation invert of 148.2 masl. On-site water level measurements show the water table ranges between approximately 145.66 to 152.50 masl. The maximum anticipated groundwater level is assumed to be at 154.0 masl to account for natural fluctuation of groundwater elevations. The maximum anticipated groundwater elevation is 5.8 m above the assumed dewatering target elevation (148.2 masl). Therefore, short-term construction dewatering is anticipated.

Construction dewatering rates were calculated using the methods outlined by Powers [8] for radial flow, water table aquifer based on the above dewatering estimate input parameters used, and a safety factor of 1.5 for construction dewatering rates and a safety factor of 1.2 for long-term seepage rates.

The Radius of Influence (ROI) due to construction dewatering is estimated to be 64.3 m from the site boundary once steady-state dewatering is reached after 40 days. The dewatering area and ROI can be seen in **Figure 2**.

5.2 Construction Dewatering Rates

Based on the above dewatering estimate assumptions, the calculated dewatering rate for initial drawdown (7 days) is 185,668 L/day (128.9 L/min). Including a safety factor of 1.5, the calculated dewatering rate for initial drawdown (7 days) is 278,502 L/day (193.4 L/min).

Once steady-state conditions have been reached (40 days), the calculated dewatering rate is 129,331 L/day (89.8 L/min).

It is also necessary to account for contributions from significant precipitation events. Assuming an excavation with dimensions of approximately 87 m x 52 m for the proposed building, the total surface area of the excavation will be 4,524 m^2. Anticipating a 15 mm daily rainfall event, the volume of rainwater contributed to this area would be 67,860 L.

The estimated maximum dewatering rate including the rainfall contribution is 346,362 L/day (240.5 L/min). Calculations are presented in **Appendix E**.

A dewatering contractor should be retained to evaluate the dewatering methods.

Based on the above estimate, a Permit to take Water would not be required for water taking during the dewatering and construction of the proposed development, as the forecasted groundwater dewatering rate is less than 400,000 L/day.

Based on the above estimate, an Environmental Activity and Sector Registry (EASR) would be required for water taking during the dewatering and construction of the proposed project, as the forecasted groundwater dewatering rate is greater than 50,000 L/day.

5.3 Long-Term Seepage Rates

It is assumed that the proposed development will be designed and constructed as water-tight without need for long-term foundation drainage.

However, if a drained foundation is used, the post-construction maximum permanent seepage has been estimated using an assumed pumping time of 365 days. Similar to the short-term dewatering rates, the long-term seepage rate assumes all of the same conditions described in Section 5.1.

The long-term seepage rate forecast at 365 days of continuous pumping with a safety factor of 1.2 is 27,878 L/day (19.4 L/min).

Since long-term dewatering is forecast to be less than 50,000 L/day, a Permit to Take Water (PTTW) will not be required from the MECP for the long-term water taking of ground water if the building is not constructed with a water-tight foundation.

6.0 Potential for Adverse Effects

The following section identifies potential adverse environmental effects of the proposed construction dewatering program.

6.1 Regulated and Sensitive Areas

According to the MECP Source Protection Information Atlas the Site is located within the Toronto Source Protection Area (TSPA) [9].

The Site is not located in an area of development control, as defined by the Niagara Escarpment Planning & Development Act or on the Oak Ridges Moraine Conservation Area, as defined by the Oak Moraine Conservation Plan.

6.2 MECP Well Records and Groundwater Resources

The area within 500 m of the Site is serviced by the City of Toronto municipal water. The City of Toronto obtains its water supply from Lake Ontario. Therefore, there is no potential for groundwater interference complaints during construction dewatering activities.

A copy of the Ministry of Environment, Conservation and Parks (MECP) well listings within 500 metres of the Site are provided in **Appendix F**. The wells within 500 metres of the Site are displayed in **Figure 3**.

There are 144 wells identified within the 500 m area surrounding the Site:

- 33 of the wells identified are documented to be monitoring wells;
- 29 of the wells are documented to be dewatering wells;
- 8 of the wells are documented to be test holes;
- 29 well are documented as monitoring and test holes;
- 4 wells not in use; and
- 1 well labeled as “other”.
- There is no information for the remaining 40 wells identified.

There are 15 wells identified in the MECP water wells database located within the ROI that are not anticipated to be decommissioned during construction of the proposed building.

Prior to construction, any inactive monitoring wells at the Site should be properly decommissioned by a drilling contractor licensed by the MECP, following Ontario Regulation 903.

6.3 Settlement

While given the very stiff to hard consistency of the clayey soils, and dense to very dense compactness condition of the sandy soils underlying the site, the anticipated dewatering of the site to lower the groundwater table below the base of the proposed excavation is not anticipated to result in significant settlement of structures adjacent to the subject Site, it is recommended that once the development plans have been finalized and the base of the proposed excavation established, a settlement analysis be carried out by the geotechnical engineer to determine the magnitude of the settlement, if any.

6.4 Recommended Additional Fieldwork and Monitoring

Monitoring and additional fieldwork are recommended during temporary construction dewatering:

- A EASR will need to be registered with the MECP to allow for water taking during construction. As

a requirement of the EASR, daily water taking volumes must be reported to the MECP on or before March 31st of each year for the previous calendar year of water taking.

- Monitoring of the discharge water quantity is required to ensure compliance with the discharge agreement and/or EASR conditions. GEMS recommends the following program for monitoring the groundwater taking and discharge volumes:

Location: A flow meter attached to the discharge pipe of the dewatering system.

Parameter: Total volume of discharge, date, and time of measurement.

Schedule: Minimum of daily recording by on-Site personnel, with values reported to the Project supervisor weekly for submission to the city, Region and/or MECP.

Trigger: Discharge volume exceeds the maximum rate of dewatering specified in the discharge agreement and/or the EASR.

Mitigation: Immediately reduce the pumping rate so that discharge is within the permitted limit.

Reporting: Values reported to the Project supervisor weekly for submission to the city, Region and/or MECP.

7.0 Qualified Professional (QP) Information

This Water Taking and Discharge Report was prepared by Logan McNabb, who holds a Bachelor of Environmental Engineering, and reviewed and approved by Dan Menard, a Professional Geoscientist Licensee in Ontario. His expertise relates to geology, hydrogeology, and dewatering.

8.0 Conclusion

Based on the above analysis, the following conclusions and recommendations are offered for the proposed development at the 2343 Eglinton Avenue West, Toronto, Ontario:

- The geology within the Site is characterized as the South Slope, including shallow shale and till plains that slope southward towards Lake Ontario.,
- The bedrock underlaying the Site is part of the Georgian Bay Formation composed primarily of shale and limestone.
    - The silt and sand and sandy clayey silt till at the Site are interpreted to all belong to the same unconfined water-bearing zone or aquifer.
- Hydraulic conductivity for the water-bearing zone (MW2 and MW4) ranged from 1.48×10^{-6} m/s to 5.36×10^{-8} m/s, with an overall geometric mean of 3.0×10^{-7} m/s.
- Groundwater table at the Site ranges from 145.66 to 152.50 masl.
    - The maximum anticipated groundwater level is estimated at 154.00 masl, incorporating a 1.5 m fluctuation allowance to account for seasonal variations.
- Groundwater quality at the Site currently exceeds both the City of Toronto Sanitary and Combined By-Law guidelines Storm Sewer By-Law guidelines for multiple parameters.
- The maximum anticipated groundwater (154.00 masl) is above the anticipated excavation invert (149.20 masl) and the assumed dewatering target elevation (148.20 masl).
- The maximum estimated rate of construction dewatering including a factor of safety of 1.5 and the contribution of rainfall is 346,362 L/day (240.5 L/min).
- The ROI for construction dewatering is expected to extend to 64.3 m beyond the excavation area.
- If the foundation is not constructed as a water-tight structure, the maximum anticipated long-term groundwater seepage rate including a factor of safety of 1.2 is 27,878 L/day (19.4 L/min).
- Well decommissioning will be required prior to construction. Any inactive wells within the Site should be decommissioned by a licensed well contractor under Ontario Regulation 903.

9.0 Limitations

Groundwater Environmental Management Services Inc. (GEMS) has prepared this report for our client and its agents exclusively. GEMS accepts no responsibility for any damages that may be suffered by third parties as a result of decisions or actions based on this report.

The findings and conclusions are site-specific and were developed in a manner consistent with that level of care and skill normally exercised by environmental professionals currently practicing under similar conditions in the area. Changing assessment techniques, regulations, and site conditions mean that environmental investigations and their conclusions can quickly become dated, so this report is current up to two years from the published date. The report should not be used after that without GEMS review/approval.

The project has been conducted according to our instructions and work program. Additional conditions, and limitations on our liability are set forth in our work program/contract. No warranty, expressed or implied, is made.

TORONTO

Statistics Template – Toronto Green Standard Version 4.0

Mid to High Rise Residential and all New Non-Residential Development

Cycling Infrastructure	Required	Proposed	Proposed %
Number of short-term bicycle parking spaces			
Number of shower and change facilities (non-residential)			

Tree Canopy	Required	Proposed	Proposed %
Total Soil Volume (40% of the site area ÷ 66 m2 x 30 m³)			
Soil volume provided within the site area (m³)			
Soil Volume provided within the public boulevard (m³)			

Section 2: For Site Plan Control Applications

Cycling Infrastructure	Required	Proposed	Proposed %
Number of short-term bicycle parking spaces (all uses) at-grade or on first level below grade			
Number of publicly accessible bicycle parking spaces			
Number of energized outlets for electric bicycles			

Tree Canopy	Required	Proposed	Proposed %
Total site area (m²)			
Total Soil Volume (40% of the site area ÷ 66 m2 x 30 m³)			
Total number of trees planted			
Number of surface parking spaces (if applicable)			
Number of shade trees located in surface parking area			

Landscaping & Biodiversity	Required	Proposed	Proposed %
Total non-roof hardscape area (m²)			
Total non-roof hardscape area treated for Urban Heat Island (minimum residential 75% or non-residential 50%) (m²)			
Area of non-roof hardscape treated with: (indicate m²)			
a) high-albedo surface material			
b) open-grid pavement			
c) shade from tree canopy			

TORONTO

Statistics Template – Toronto Green Standard Version 4.0

Mid to High Rise Residential and all New Non-Residential Development

Landscaping & Biodiversity	Required	Proposed	Proposed %
d) shade from high-albedo structures			
e) shade from energy generation structures			
Percentage of Lot Area as Soft Landscaping (non-residential only)			
Total number of plants			
Total number of native plants and % of total plants			
Available Roof Space (m²)			
Available Roof Space provided as Green Roof (m²)			
Available Roof Space provided as Cool Roof (m²)			
Available Roof Space provided as Solar Panels (m²)			

Bird Collision Deterrence	Required	Proposed	Proposed %
Total area of glazing of all elevations within 16m above grade			
Total area of treated glazing (minimum 85% of total area of glazing within 16m above grade) (m²)			
Percentage of glazing within 16m above grade treated with:			
a) Visual markers			
b) non-reflective glass			
c) Building integrated structures

	VEHICULAR EXIT/ENTRANCE	158.700m = ESTABLISHED GRADE 158.700m = TOS GROUND FLOOR AVERAGE	

SITE PLAN NOTES

1. THE BUILDING IS TO BE SPRINKLERED.
2. TORONTO HYDRO STREET LIGHTING AND TYPE TO BE COORDINATED WITH AND APPROVED BY TORONTO HYDRO.
3. ALL WASTE GENERATED BY THE SITE TO BE STORED ON PRIVATE PROPERTY.
4. SIDEWALKS AND BOULEVARDS WITHIN THE RIGHT OF WAY TO HAVE A MINIMUM 2% AND MAXIMUM 4% SLOPE TOWARDS THE ROADWAY.
5. REFER TO SITE SERVICING PLAN, PREPARED BY XXX, FOR SEWER AND WATER SERVICE INFORMATION.
6. ALL EXISTING ACCESSES, CURB CUTS, TRAFFIC CONTROL SIGNS, ETC. ALONG THE DEVELOPMENT SITE FRONTAGES THAT ARE NO LONGER REQUIRED ARE TO BE REMOVED. THE BOULEVARD WITHIN THE PUBLIC RIGHT OF WAY, IN ACCORDANCE WITH CITY STANDARDS AND TO THE SATISFACTION OF THE EXECUTIVE DIRECTOR OF TECHNICAL SERVICES ARE TO BE REINSTATED.
7. TYPICAL PARKING SPACES ARE 2.6m X 5.6m. SPACES WITH ADJACENT OBSTRUCTIONS OF A DEPTH GREATER THAN 1m TO HAVE A TYPICAL ALLOWANCE OF 0.3m FROM PARKING SPACE.
8. ALL SMALL CAR PARKING SPACES TO BE CLEARLY SIGNED AT THE FRONT OF EACH SPACE AS "SMALL CAR ONLY"
9. EXTERIOR LIGHTING WILL BE FULL CUT-OFF FIXTURES (OR DARK SKY COMPLIANT) SO THAT NO UP-LIGHTING WILL BE PRODUCED FROM THESE LIGHTS AND EXTERIOR LIGHT FIXTURES ARE SHIELDED TO PREVENT GLARE AND LIGHT TRESPASS ONTO ANY NEIGHBORING PROPERTIES
10. SHORT-TERM BIKE PARKING: MIN. LENGTH 1.8m, MIN. WIDTH 0.6m,MIN. VERTICAL CLEARANCE 1.9m

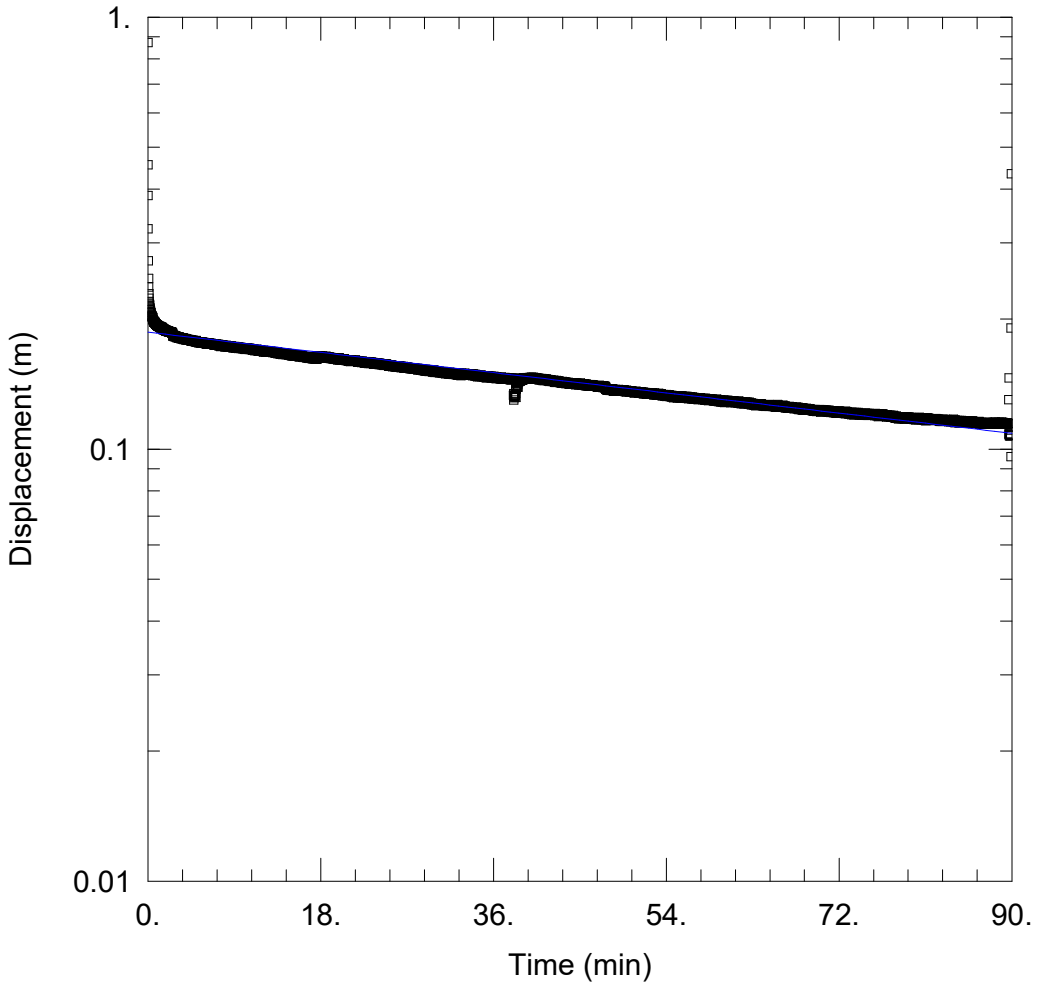
Appendix C

Hydraulic Conductivity



HYDRAUIC CONDUCTIVITY TEST 1 - MW2

PROJECT INFORMATION

Company: GEMS
Client: 1764174 Ontario Inc.
Project: 24-0022
Location: 2343 Eglinton Avenue West
Test Well: MW2
Test Date: 2024-09-10

AQUIFER DATA

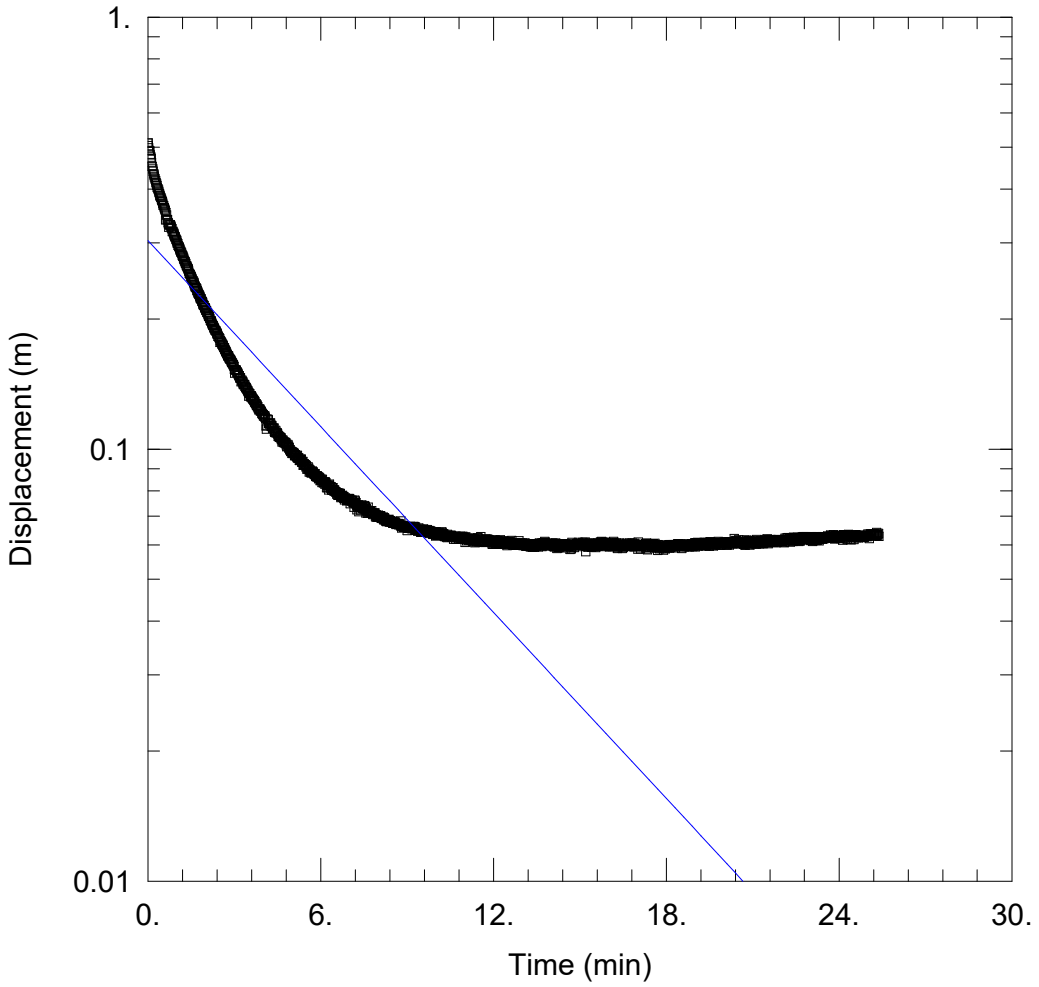
Saturated Thickness: 23.29 m
Anisotropy Ratio (Kz/Kr): 1.

WELL DATA (MW2)

Initial Displacement: 0.8736 m
Total Well Penetration Depth: 3. m
Casing Radius: 0.026 m
Static Water Column Height: 1.29 m
Screen Length: 3. m
Well Radius: 0.0254 m

SOLUTION

Aquifer Model: Unconfined
Solution Method: Hvorslev
K = 5.365E-8 m/sec
y0 = 0.1865 m



HYDRAUIC CONDUCTIVITY TEST 1 - MW4

PROJECT INFORMATION

Company: GEMS
Client: 1764174 Ontario Inc.
Project: 24-0022
Location: 2343 Eglinton Avenue West
Test Well: MW4
Test Date: 2024-09-10

AQUIFER DATA

Saturated Thickness: 16.65 m
Anisotropy Ratio (Kz/Kr): 1.

WELL DATA (MW4)

Initial Displacement: 0.5111 m
Total Well Penetration Depth: 6.15 m
Casing Radius: 0.026 m
Static Water Column Height: 6.15 m
Screen Length: 3. m
Well Radius: 0.0254 m

SOLUTION

Aquifer Model: Unconfined
Solution Method: Hvorslev
K = 1.48E-6 m/sec
y0 = 0.3039 m

Volatile Organic Compounds in Water	1	N/A	2023/11/02	CAM SOP-00228	EPA 8260D

Remarks:

Bureau Veritas is accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Bureau Veritas are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCCFP, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Bureau Veritas' profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Bureau Veritas in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

Version: 1 - Final

CERTIFICATE OF ANALYSIS

BUREAU VERITAS JOB #: C3X5217

Received: 2023/10/26, 15:29

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.
Results relate to samples tested. When sampling is not conducted by Bureau Veritas, results relate to the supplied samples tested.

Reference Method suffix “m” indicates test methods incorporate validated modifications from specific reference methods to improve performance.
* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.
(1) Total PAHs include only those PAHs specified in the sewer use by-by-law.
(2) Note: TPH (Heavy Oil) is equivalent to Mineral / Synthetic Oil & Grease

Encryption Key

==========

This report has been generated and distributed using a secure automated process.
Bureau Veritas has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per ISO/IEC 17025, signing the reports. For Service Group specific validation, please refer to the Validation Signatures page if included, otherwise available by request. For Department specific Analyst/Supervisor validation names, please refer to the Test Summary section if included, otherwise available by request. This report is authorized by Rodney Major, General Manager responsible for Ontario Environmental laboratory operations.

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	5.7°C

Sample XKM715 [EAW MW4 2343 EGLINTON AVE W] : VOC Analysis: Due to high concentrations of target analytes, sample required dilution. Detection limits were adjusted accordingly. In order to meet required regulatory criteria or to achieve lower reporting limits, results for selected compounds (obtained by a separate analysis using an appropriate low dilution) are included in the report.

ABN Analysis: Due to the sample matrix, a smaller than usual portion of the sample was used for extraction. Detection limits were adjusted accordingly.

Results relate only to the items tested.

N/A = Not Applicable

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

QC Standard: A sample of known concentration prepared by an external agency under stringent conditions. Used as an independent check of method accuracy.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

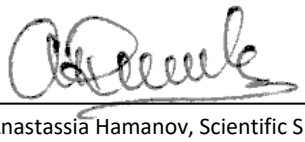
VALIDATION SIGNATURE PAGE

The analytical data and all QC contained in this report were reviewed and validated by:



Anastassia Hamanov, Scientific Specialist

Brad Newman, B.Sc., C.Chem., Scientific Service Specialist

Soham Patel, Senior Analyst

Bureau Veritas has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per ISO/IEC 17025, signing the reports. For Service Group specific validation, please refer to the Validation Signatures page if included, otherwise available by request. For Department specific Analyst/Supervisor validation names, please refer to the Test Summary section if included, otherwise available by request. This report is authorized by Rodney Major, General Manager responsible for Ontario Environmental laboratory operations.

HYDROLOGICAL REVIEW SUMMARY

The form is to be completed by the Professional that prepared the Hydrological Review.
Use of the form by the City of Toronto is not to be construed as verification of engineering/hydrological content.

Refer to the Terms of Reference, Hydrological Review:
Link to Terms of Reference Hydrological Review

For City Staff Use Only:	
Name of ECS Case Manager (Please print)	
Date Review Summary provided to to TW, EM&P	

IF ANY OF THE REQUIREMENTS LISTED BELOW HAVE NOT BEEN INLCUDED IN THE HYDROLOGICAL REVIEW, THE REVIEW WILL BE CONSIDERED INCOMPLETE.
THE GREY SHADED BOXES WILL REQUIRE A CONSISTANCY CHECK BY THE ECS CASE MANAGER.

Summary of Key Information:

		in the Review	
The groundwater level has been monitored using all wells located on site (within property boundary).	Yes.	Pg. 4-6, Sec. 4.3	
The static water level measurements have been monitored at all monitoring wells for a minimum of 3 months with samples taken every 2 weeks for a minimum of 6 samples. The intent is for the qualified professional to use professional judgement to estimate the seasonally high groundwater level.	Yes.	Pg. 4-6, Sec. 4.3	
All water levels in the wells have been measured with respect to masl.	Yes.	Pg. 4-6, Sec. 4.3	
A table of geology/soil stratigraphy for the property has been included.	Yes.	Pg. 4, Sec. 4.2	
GEOLOGY AND PHYSICAL HYDROLOGY		**Page # & Section # of every occurrence in the Review**	**Review Includes this Information (City Staff Initial)**
The review has made reference to the soil materials including thickness, composition and texture, and bedrock environments.	Yes.	Pg. 4, Sec. 4.2	
Key aquifers and the site's proximity to nearby surface water has been identified.	☒ **Yes**	Pg. 1, Sec. 2.1	N/A

HYDROLOGICAL REVIEW SUMMARY

SITE INFORMATION		Page # & Section # of Review	Review Includes this Information City Staff (Check)
The report includes baseline water quality samples from a laboratory. The water quality must be analyzed for all parameters listed in Tables 1 and 2 of Chapter 681 Sewers of the Toronto Municipal Code (found in Appendix A) and the samples must have to be taken unfiltered within 9 months of the date of submission.	Yes.	Appendix D	
The water quality data templates in Appendix A have been completed for each sample taken for both sanitary/combined and storm sewer limits.	Yes.		
Qualified professional to list all sample parameters that have violated the Bylaw limits for each sample taken for the sanitary/combined Bylaw limits **If there are any sample parameter Exceedances the groundwater can't be discharged as is.**	Benzene and Toluene exceed sanitary/combined Bylaw limits.	Appendix D	
Qualified professional to list all sample parameters that have violated the Bylaw limits for each sample taken for the storm Bylaw limits. **If there are any sample parameter exceedances the groundwater can't be discharged as is.**	Phenols-4AAP, Total Suspended Solids, Total Manganese, Total PAHs, Benzene, Chloroform, Ethylbenzene, Toluene, and Total Xylenes exceed storm Bylaw limits.	Appendix D	
The water quality samples have been analyzed by a Canadian laboratory accredited and licensed by Standards Council of Canada and/or Canadian Association for Laboratory Accreditation.	☒ **Yes**		N/A

SERVICING REPORT GROUNDWATER SUMMARY

The form is to be completed by the Professional that prepared the Servicing Report.
Use of the form by the City of Toronto is not to be construed as verification of engineering/hydrological content.

For City Staff Use Only:	
Name of ECS Case Manager (please print)	
Date Review Summary provided to to TW	

A. SITE INFORMAITON		Included in SR (reference page number)	Report Includes this information City staff (Check)
Date Servicing Report was prepared: March 14, 2025		Cover Page	
Title of Servicing Report: Functional Servicing and Stormwater Management Report		Cover Page	
Name of Consulting Firm that prepared Servicing Report: Counterpoint Engineering		Cover Page	
Site Address	2343 Eglinton Avenue West Toronto, Ontario	Cover Page	
Postal Code			
Property Owner (identified on planning request for comments memo)	1764174 Ontario Inc.	Cover Page	
Proposed description of the project (ex. number of point towers, number of podiums, etc.)	The proposed mixed-use (commercial/residential) development consists of a forty-three (43) storey building with two (2) levels of underground parking.	Section 1.1 Background, Pages 4	
Land Use (ex. commercial, residential, mixed, industrial, institutional) as defined by the Planning Act	Mixed-use	Section 1.1 Background, Pages 4	
Number of below grade levels	The proposed underground will be two (2) levels.	Section 1.1 Background, Pages 4	

October 2017

SERVICING REPORT GROUNDWATER SUMMARY

Does the SR include a private water drainage system (PWDS)? **PWDS: Private Water Drainage System:** A subsurface drainage system which may consist of but is not limited to weeping tile(s), foundation drain(s), private water collection sump(s), private water pump or any combination thereof for the disposal of private water on the surface of the ground or to a private sewer connection or drainage system for disposal in a municipal sewer.	If **Yes** continue completing Section B (Information Relating to Groundwater) **ONLY** **If Yes, Number of PWDS?** **ONE (Construction Discharge Only)** *(Each of these PWDS may require a separate Toronto Water agreement)* If **No** skip to Sections C (On-site Groundwater Containment) and/or D (Water Tight Requirements) as applicable	◯ YES ◯ NO	
B. INFORMATION RELATING TO GROUNDWATER		**Included in SR (reference page number)**	**Report Includes this information City Staff (Check)**
A copy of the pump schedule(s) for **ALL** groundwater sump pump(s) for the development site has been included in the SR **or** A letter written by a Mechanical Consultant (signed and stamped by a Professional Engineer of Ontario) shall be attached to the SR stating the peak flow rate of the groundwater discharge for the development site for all groundwater sump pump(s). This peak flow rate must be based on the pump schedule(s) that have been designed by the Mechanical Consultant. A template of this letter is attached in Schedule A. ****If there is more than one groundwater sump they must ALL be included in the letters along with a combined flow****	To be provided during Private Water Discharge Permit Application by Dewatering Contractor	Section 4.0 Foundation Drainage, Page 9	
Is it proposed that the groundwater from the development site will be discharged to the	◯ Sanitary Sewer	Section 4.0 Foundation	

SERVICING REPORT GROUNDWATER SUMMARY

sanitary, combined or storm sewer?	◯ Combined Sewer ◯ Storm Sewer	Drainage, Page 9	
Will the proposed PWDS discharge from the site go to the Western Beaches Tunnel (WBT)? *Reference attached WBT drainage map*	◯ YES ◯ NO **If Yes, private water discharge fees will apply and site requires a sanitary discharge agreement.**		
What is the street name where the receiving sewer is located?	Caledonia Road	Section 4.0 Foundation Drainage, Page 9	
What is the diameter of the receiving sewer?	750 mm	Section 4.0 Foundation Drainage, Page 9	
Is there capacity in the proposed local sewer system? ◯ YES ◯ NO	Are there any improvements required to the sewer system? If yes, identify them below and refer to the section and page number of the SR where this information can be found. If a sewer upgrade is required, the owner is required to enter into an Agreement with the City to improve the infrastructure? ◯ YES	Section 5.2 Proposed Sanitary Servicing, Pages 10-11	
Total allowable peak flow rate during a 100 year storm event (L/sec) to storm sewer When groundwater is to be discharged to the storm sewer the total groundwater and stormwater discharge shall not exceed the permissible peak flow rate during a 2 year pre development storm event, as per the City's Wet Weather Flow Management Guidelines, dated 2006	56.5 L/sec Discharge to combined sewer	Section 6.2 Allowable Release Rate, Page 14	

SERVICING REPORT GROUNDWATER SUMMARY

Short-Term Groundwater Discharge Provide proposed total flow rate to the sanitary/combined sewer in post-development scenario Total Flow (L/sec) = sanitary flow + peak short-term groundwater flow rate	The site will not be occupied during construction, no sanitary flow 3.22 = 0 + 3.22 L/sec	Section 4.0 Foundation Drainage, Page 9	
Long-Term Groundwater Discharge Provide proposed total flow rate to the sanitary/combined sewer in post-development scenario Total Flow (L/sec) = sanitary flow + peak long-term groundwater flow rate	Proposed building will be constructed watertight, no long-term groundwater discharge 12.44 = 12.44 + 0 L/sec	Section 5.2 Proposed Sanitary Servicing, Page 10	
Does the water quality meet the receiving sewer Bylaw limits? ◯ YES ◯ NO	If the water quality does not meet the applicable receiving sewer Bylaw limits and the applicant is proposing a treatment system the applicant will need to include a letter stating that a treatment system will be installed and the details of the treatment system will be included in the private water discharge application that will be submitted to TW EM&P.	Section 4.0 Foundation Drainage, Page 9	
C. ON-SITE GROUNDWATER CONTAINMENT		**Included in SR (reference page number)**	**Report Includes this information City Staff (Check)**
How is the site proposing to manage the groundwater discharge on site?	To be provided by dewatering contractor		

October 2017

SERVICING REPORT GROUNDWATER SUMMARY

Has the above proposal been approved by:	◯ TW-WIM And ◯ TW-EM&P And ◯ ECS		
If the site is proposing a groundwater infiltration gallery, has it been stated that the groundwater infiltration gallery will not be connected to the municipal sewer? A connection between the infiltration gallery/dry well and the municipal sewer is not permitted Please be advised if an infiltration gallery/dry well on site is not connected to the municipal sewer, the site **must** submit two letters using the templates in Schedule B and Schedule C.	◯ YES ◯ NO		
Confirm that the infiltration gallery can infiltrate 100% of the expected peak groundwater flow year round, ensure that the top of the infiltration trench is below the frost line (1.8m depth), not less than 5 m from the building foundation, bottom of the trench 1m above the seasonally high water table, and located so that the drainage is away from the building.			
D. WATER TIGHT REQUIREMENTS		**Included in SR (reference page number)**	**Report Includes this information City Staff (Check)**
If the site is proposing a water tight structure: 1. The owner must submit a letter using the template in Schedule D.		N/A	

SERVICING REPORT GROUNDWATER SUMMARY

2. A Professional Engineer (Structural), licensed to practice in Ontario and qualified in the subject must submit a letter using the template in Schedule E. 3. A Professional Engineer (Mechanical), licensed to practice in Ontario and qualified in the subject must submit a letter using the template in Schedule F.		

Provide a copy of the approved SR to Toronto Water Environmental Monitoring & Protection Unit at pwapplication@toronto.ca.
